

Caption Generator for Images powered by Watson Visual Recognition

Prepared by

Kakkireni Naga Pavani

Assistant Professor

Department of Electronics and Communication Engineering. Gokaraju

Rangaraju Institute of Engineering & Technology.

Hyderabad.

The logo for 'Caption Generator' is displayed on a yellow rectangular background. The word 'Caption' is written in white text inside a black rectangular box, and the word 'Generator' is written in black text to the right of this box.

Caption Generator

Introduction:

Image Captioning refers to the process of generating textual description from an image, based on the objects and actions in the image. The ability to recognize image features and generate accurate, syntactically reasonable text descriptions is important for many tasks in computer vision. For example:

(1) Self-driving cars:

Automatic driving is one of the biggest challenges and if we can properly caption the scene around the car, it can give a boost to the self-driving system.

(2) Aid for visually challenged:

This can help us create a product for the blind which will guide them to travel on the roads without the support of anyone else. This can be implemented by first converting the scene into text and then the text to voice.

CCTV cameras are everywhere today, but along with viewing the world, if we can also generate relevant captions, then we can raise alarms as soon as there is some malicious activity going on somewhere. This could probably help reduce some crime and/or accidents.

Proposed Solution :

This project aims at building an application which takes input as image analyses it and generate the captions in the form of speech. To achieve this, IBM Services like node-red service is used to build a web UI where user uploads a picture. This picture is analyzed by Watson visual recognition service and the analyzed description is then converted into speech using text to speech service.

Workflow of the project:

The project involves the 3 processes mentioned below.

Process 1: Create IBM Academic Initiative Account

Step 1: IBM Academic Initiative Account

Step 2: Create Node-red Starter Service

Step 3: Create Visual recognition Service

Step 4: Create Text to speech service

Process 2: Build basic node red flow

Step 1: Install browser-utils

Step 2: Install dashboard nodes

Step 3: Nodes to be used

Process 3: Create Node-red Dashboard

Step 1: Insert template node to create Basic html Page

Step 2: Deploy and Open the page

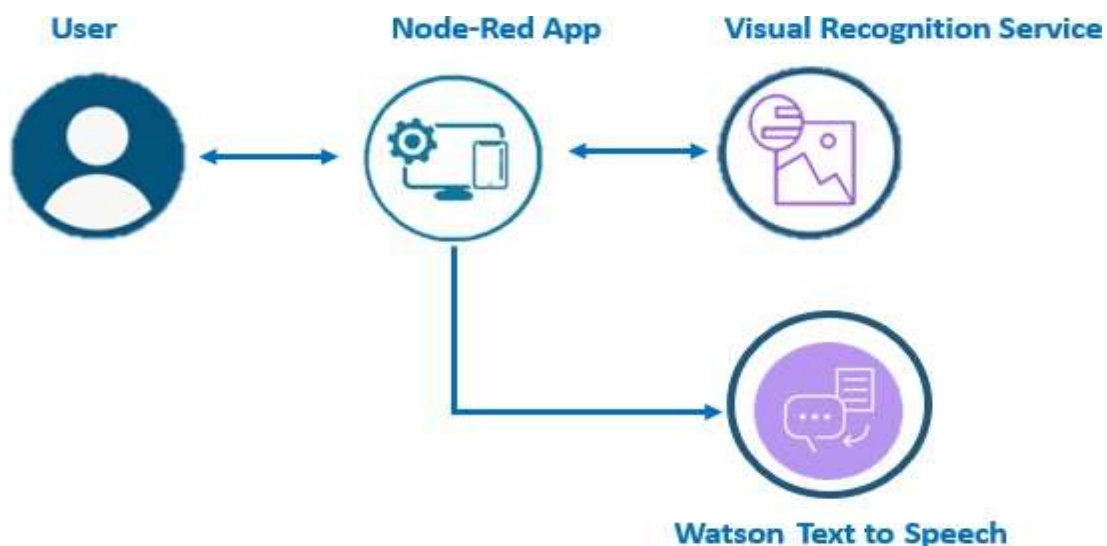

Fig. 1 Architecture of the caption generator

Implementation of the project:

Visual Recognition Service:

The project is implemented by using the pre-built model in Visual Recognition service, which generates class keywords that describe the image. Given any input image, the classes are identified and given a confidence score which is nothing but the probability with which each class is identified.

Text to Speech Service:

The text to speech service enables us to provide speech output for any text given to it as input.

Node-Red Service:

Once the classes in the image is classified, in order to have a web UI, node-red service is used. The web UI design is designed such a way that it gets an image as input from the user. This is then analyzed by Visual Recognition service and we obtain the class and the corresponding confidence scores. The caption text to be displayed is decided based on the confidence score and this is fed to the text to speech service to read that text. Fig. 2 shows the different nodes deployed for the web UI using node-red.

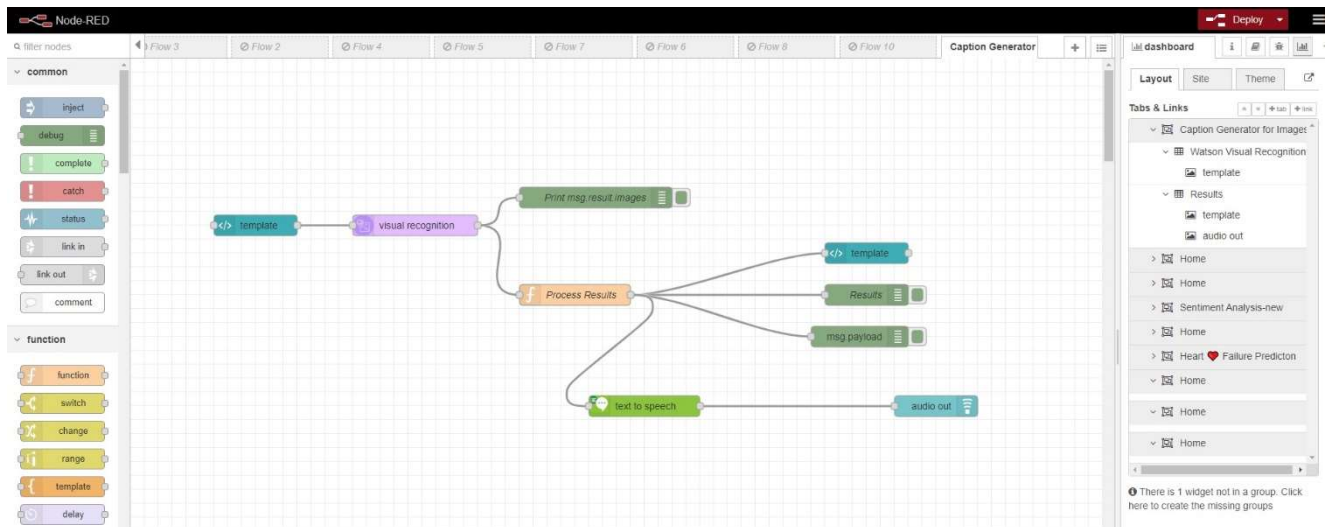

Fig.2 Nodes deployed in node-red

Experimental Results:

Once the nodes are deployed, the web UI is displayed as shown in Fig. 3.

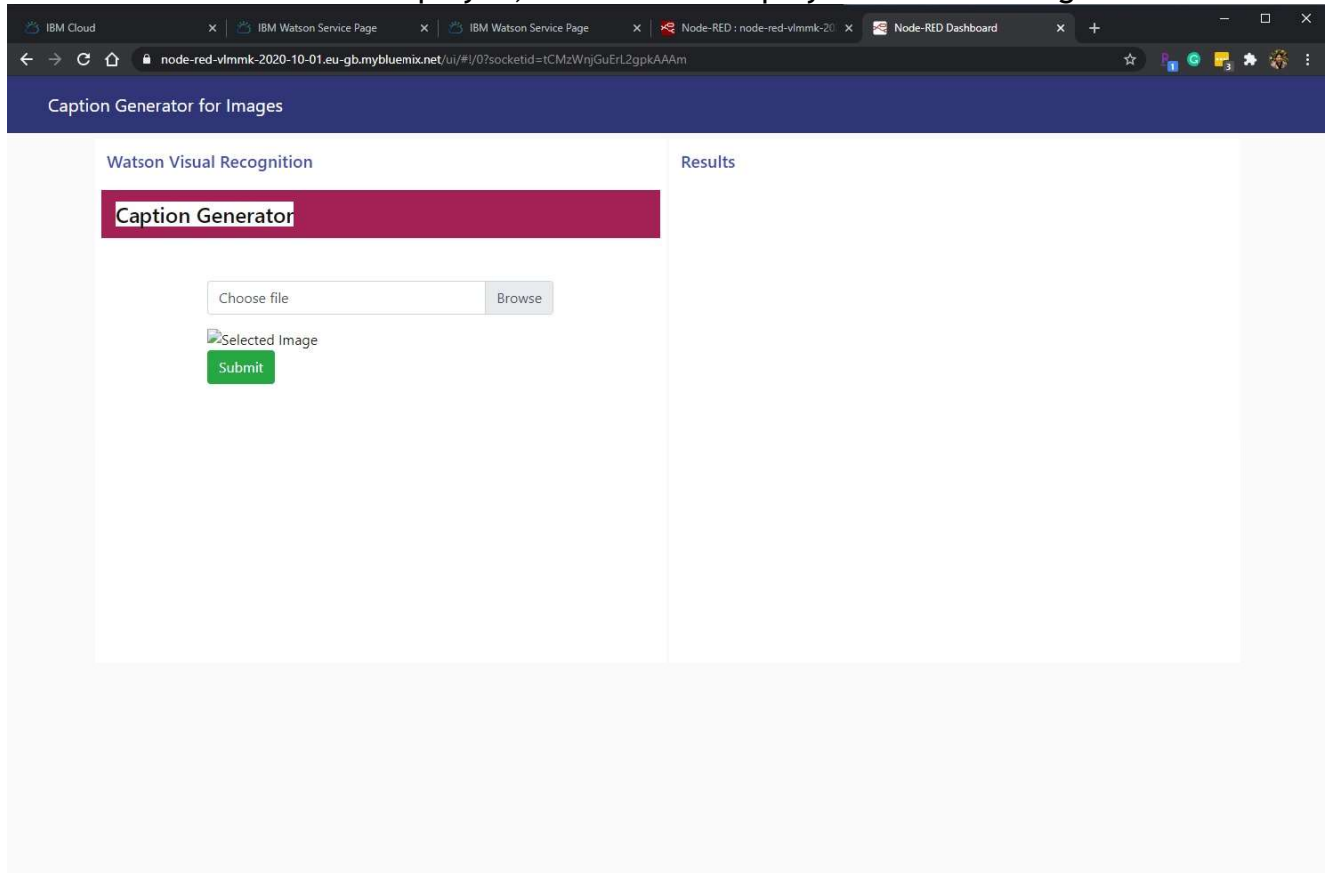

Fig. 3 Deployment of web UI using node-red service

By uploading different images, the results are obtained as shown in Figs. 4-7.

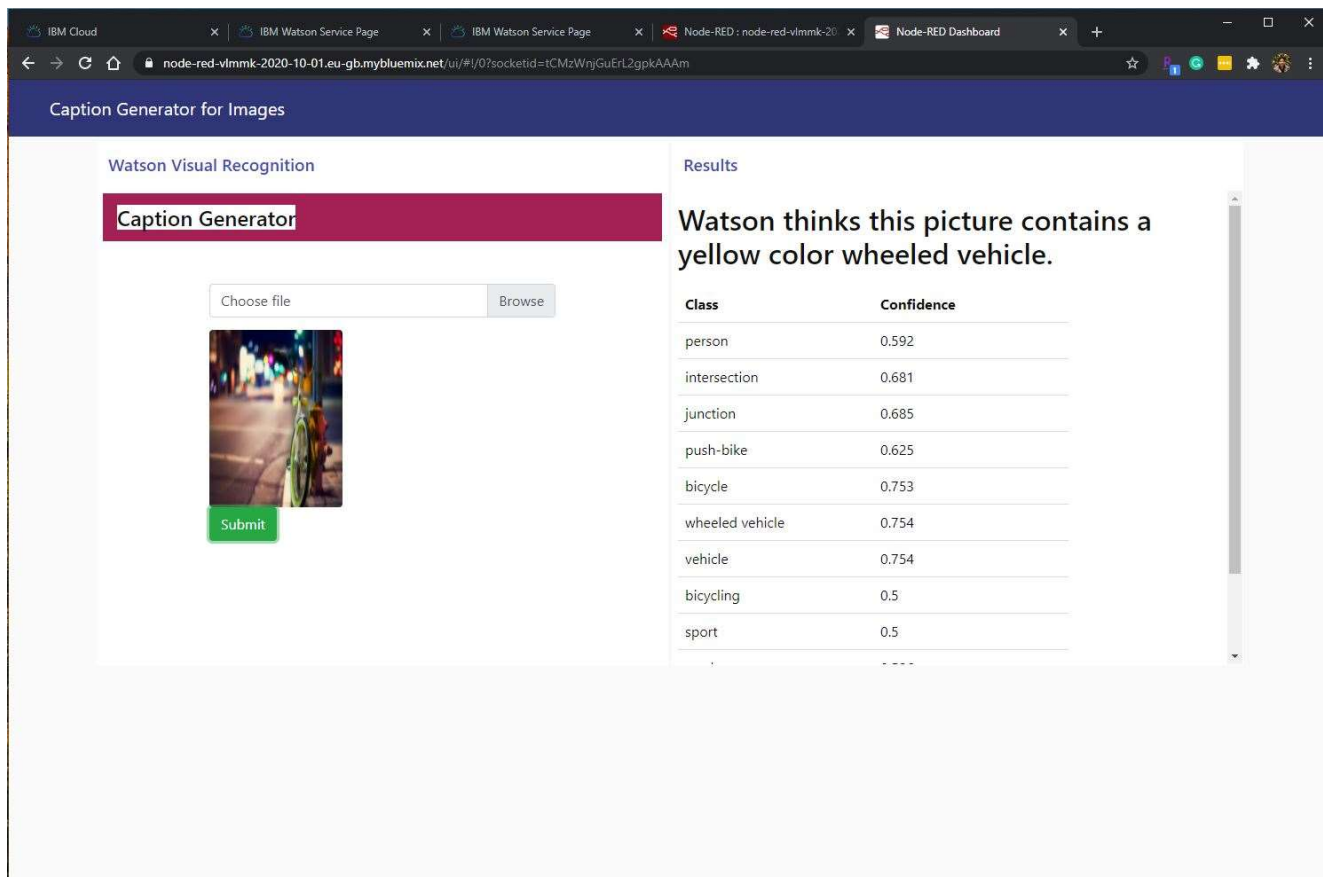

Fig. 6 Output for image 4

Conclusion:

The caption generator for images is developed using several Watson services such as visual recognition, text to speech and node-red. This caption generator can be used for several applications such as autonomous driving, aid for visually challenged, alarming the authorities in case of accidents or crime scenes.

Future scope:

The developed caption generator can be made effective by giving the proper caption instead of identifying a single keyword.

Appendix

A. Source code to obtain input image from user
